

PUSHDOWN AUTOMATA

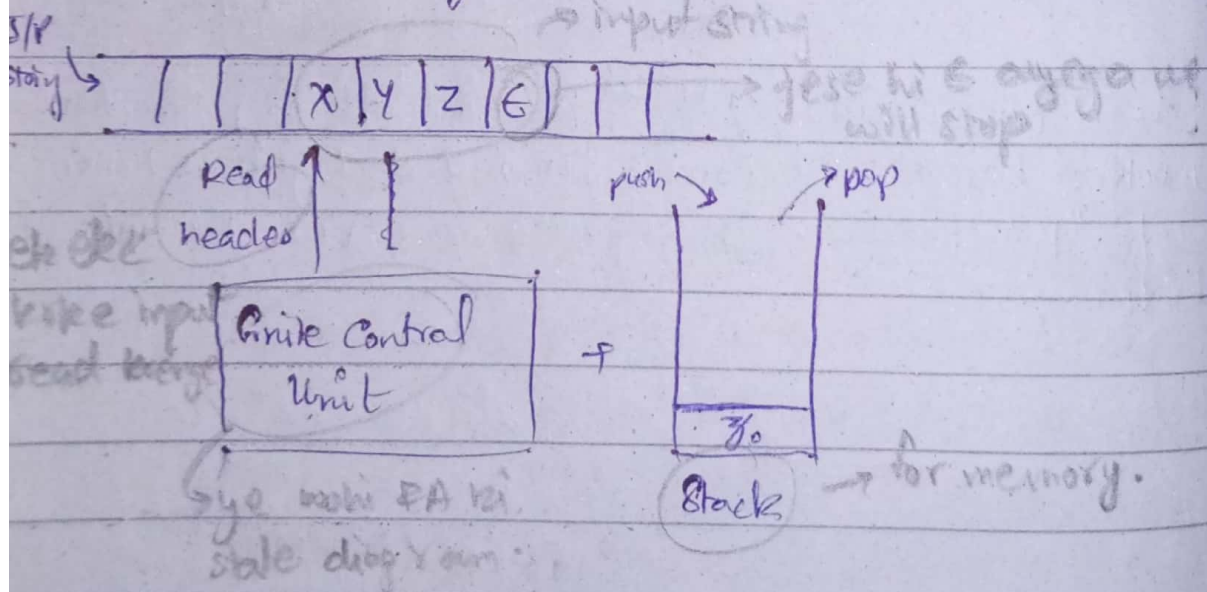

CFG \Rightarrow CFL \rightarrow PDA

→ Every NDPDA cannot be converted to DPDA.

→ CFL is divided into $\left\{ \begin{array}{l} \text{DCFL} \rightarrow \text{which can be design by DPDA} \\ \text{CFL} \rightarrow \text{NDPDA} \end{array} \right.$

→ A PDA is nothing but a Finite Automata with "Stack".

$PDA = \{Q, \Sigma, q_0, F, Z_0, \Gamma, \delta\}$

Q = Finite set of states.

Σ = Input Alphabet

q_0 = Initial State (only one)

F = Final State (0 or many more)

Z_0 = Bottom / Initial Stack Symbol (last element of stack when we encounter it means stack is empty)

Γ = Stack Alphabet (ye kharane ching k alphabet hai or symbol se hum string ko represent kar sakte hai)

δ = Transition Function

$\delta \subseteq F, Z_0 \in \Gamma$

DPDA : $Q \times (\Sigma \cup \epsilon) \times \Gamma \rightarrow Q \times \Gamma^*$

NDPDA : $Q \times \Sigma \times \Gamma^* \rightarrow Q \times \Gamma^*$

transition idhe waqt keen cheezon ko dekhne hoga.

① Current state ② Input symbol ③ Top element of stack.

After transition we move to new state and can perform three operations on stack (i) push (ii) pop (iii) skip

→ Ek baar mein ek hi kar push/pop kar sakte hai (mean donot do anything)

→ Basic Operations on Stack :

① Push

a | b |

on state q_i if we have input 'a' and top element is Z_0 we move to q_j with new state & stack as aZ_0

$q_i \xrightarrow{a, Z_0 / aZ_0} q_j$

$\delta(q_i, a, Z_0) = (q_j, aZ_0)$

② Pop

$q_i \xrightarrow{a, c / \epsilon} q_j$

if state q_i and top element is 'c' we move to q_j with new state & stack as aZ_0

$\delta(q_i, a, c) = (q_j, \epsilon)$

③ Skip (no push no pop)

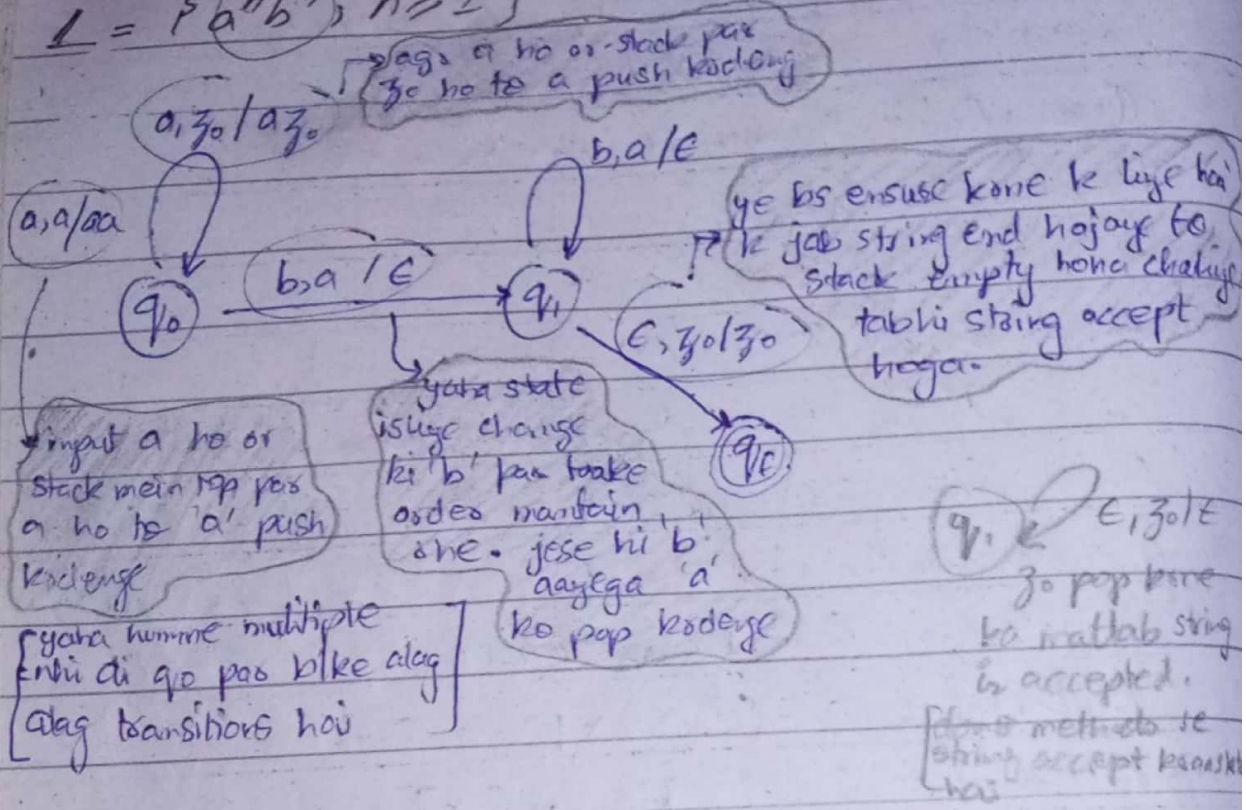

$q_i \xrightarrow{a, b / b} q_j$

if state q_i and top element is 'b' we move to q_j with new state & stack as aZ_0

$\delta(q_i, a, b) = (q_j, b)$

→ hum phile case "a's" ko push kr denge
or plus jha has ek 'a' pop kr denge or 'b' generate
kr denge so no. of a = no. of b's

$$L = \{a^n b^n, n \geq 1\}$$

→ Hum has state per sare transitions show nhi kr denge warna
bhot complex hojayege. Bs hsi ek transition ko liye
multiple options kr denge in DPDA.

→ No Transition Table.

→ Only Transition ID's.

- $\delta(q_0, a, z_0) = (q_0, az_0)$
- $\delta(q_0, a, a) = (q_0, aa)$
- $\delta(q_0, b, a) = (q_1, \epsilon)$
- $\delta(q_1, b, a) = (q_1, \epsilon)$
- $\delta(q_1, \epsilon, z_0) = (q_f, z_0)$ or $\delta(q_1, \epsilon, z_0) = (q_f, \epsilon)$

$$L = \{ w c w^R \mid w \in \{a^n b^n c^n, n \geq 1\} \}$$

$$L = \{ a^n b^n, n \geq 1 \}$$

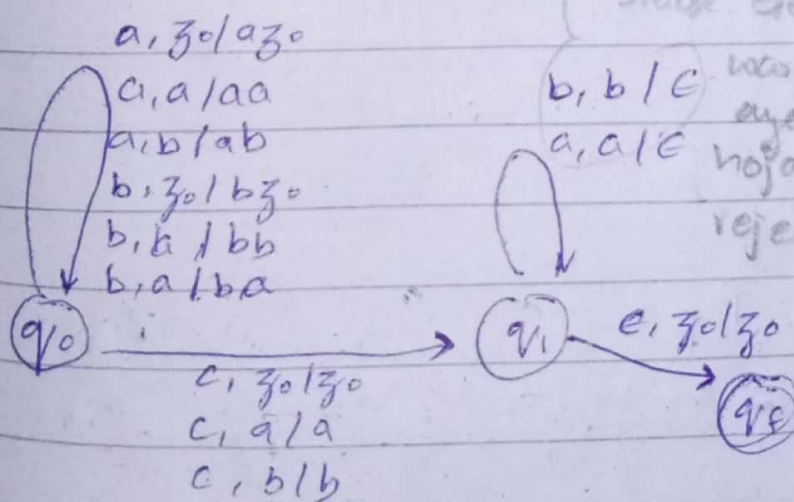

phile saare a's ko push. Phir ek 'b' ko skip or and b k liye 'a' ko pop.

$$L = \{ w (c) w^R, w \in \{a, b\}^* \} \quad [\text{palindrome}]$$

$w = aaba$ \rightarrow or separates which tells that w has ended
 $w^R = abaa$ (reverse)

\rightarrow phile poori w ko push koderge or jab c ayega to state change krke hum topmost element ko apne current input se match krenge agr wo same hai to pop.

agr jo input hai wohi stack element hai to pop

naana iske ilawa kuch aya to system halt hojayege or string reject

skip
 bs transition change kr rhe hai

ab aab

aabbaab

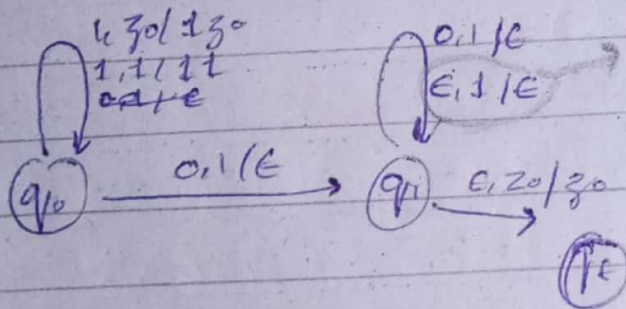

babbaabaa
aabaabba

a, 30/a

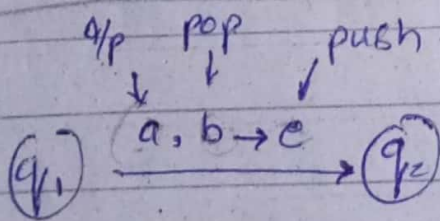

$L = \{w \mid a=b, w \in \{a,b\}^*\}$

Q: $L = \{a^m b^n \mid m \geq n\}$

iska matlab string end
hoga lekin abhi bhi
1 mgood hai matlab
1's zero se zyada hai.

$\{a, b\}$
 $\{a, b\}$

Push	Pop	Skip	Replace
$q_1 \xrightarrow{a, c \rightarrow c} q_2$ pushing c when a is i/p	$q_1 \xrightarrow{a, b \rightarrow \epsilon} q_2$ popping b when a is input	$q_1 \xrightarrow{a, \epsilon \rightarrow \epsilon} q_2$ neither pop nor push	$q_1 \xrightarrow{a, b \rightarrow c} q_2$ replacing b with c

"NON-DETERMINISTIC"

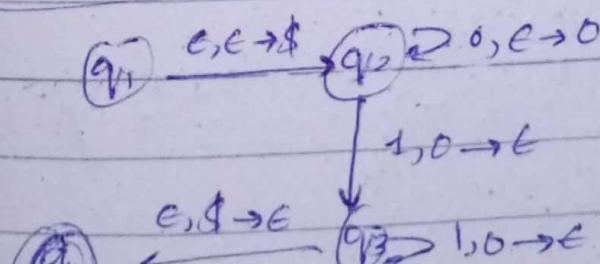

$$L = \{a^n b^n ; n \geq 0\}$$

→ A string is accepted if there is a computation such that
 (i) All inputs are consumed & (ii) The last state is an accepting state

SIPSEK VERSION

Input:	0			1			ε		
Stack:	0	\$	ε	0	\$	ε	0	\$	ε
q_1	$\{ (q_1, 0) \}$			$\{ (q_1, \epsilon) \}$			$\{ (q_2, \$) \}$		
q_2	$\{ (q_2, 0) \}$			$\{ (q_3, \epsilon) \}$					
q_3				$\{ (q_3, \epsilon) \}$			$\{ (q_4, \epsilon) \}$		
q_4									

→ Pushing & Popping Strings:

i/p pop push string

||

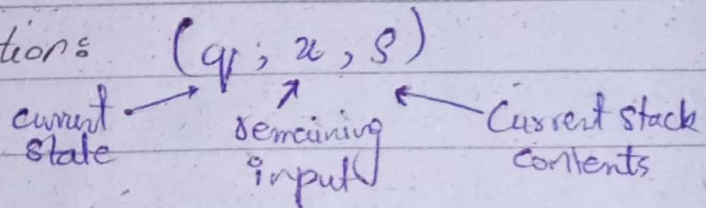

pop

push

Transition function: $\delta(q_1, a, w_1) = \{q_2, w_2\}$

Instantaneous Description:

Example:

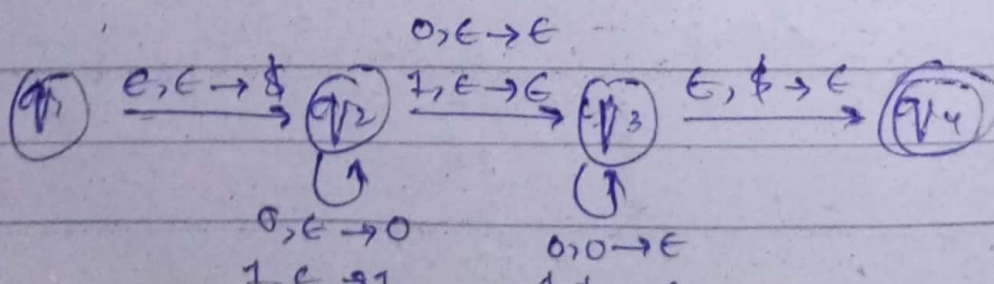

i/p: aaabbb

$(q_1, bbb, aa\$)$

See Slide # 7 (Week # 14 PDA.pdf)

$L = \{ w \in \{0,1\}^* \mid w = w^R \text{ \& length of } w = \text{odd} \}$

$\overline{EE} \rightarrow \overline{E} \overline{E}$ to $\overline{E} \overline{E} \overline{E}$

$$S \rightarrow aSb$$

$$S \rightarrow ab$$

jitne bhi

$$① \delta(q, \epsilon, \epsilon) = (q, z_0) \Rightarrow \text{Start se pehle } z_0 \text{ push kare}$$

$$② \delta(q, \epsilon, S) = (q, S) \Rightarrow \text{This Start symbol Push hogya}$$

$$③ \delta(q, \epsilon, S) = (q, aSb) \Rightarrow \text{ago top of stack mein } S \text{ hai to hum poori right hand side ko push karenge.}$$

$$④ \delta(q, \epsilon, S) = (q, ab)$$

Rule: Jabse non-terminals k liye yehi karenge k ago wo top of stack mein encounter ho to unki production ki right hand side push karenge.

"aSb" ko ek saath push nhi kar sakte is waja se multiple states bnake push karenge.

$$\delta(q, S \rightarrow aSb) = \delta(q, S \rightarrow b) \rightarrow \delta(q, \epsilon \rightarrow S) \rightarrow \delta(q, \epsilon \rightarrow a)$$

$$⑤ \delta(q, a, a) = (q, \epsilon) \Rightarrow \text{jo bhi terminal top of stack mein milega usko pop karenge}$$

$$⑥ \delta(q, b, b) = (q, \epsilon) \Rightarrow$$

$$⑦ \delta(q, \epsilon, z_0) = (q, z_0) \rightarrow \text{accept state (as we reach final state)}$$
